

FEEDING SCHEDULE

EasyPro

SUPER FOOD
FOR PLANTS

Grams / 10L	Seedlings & cuttings	Large plants	Flowering	Fruiting
Part 1	5	10	10	10
Part 2	5	10	10	10
Harvest Booster			2	2

(Teaspoon approx. 5g)

[FATALII.NET/FF](https://fatalii.net/ff)

Example

(recommended method)

50 liters of ready-to-use nutrient solution for seedlings / small plants with hydro or soil:

1. Add 50L of water to your reservoir.
2. Mix 25g (5g/10L) of **EasyPro Part 1** in a jar of water (preferably warm) and pour it to the reservoir.
3. Repeat step 2. with **EasyPro Part 2**.
4. Mix the solution in reservoir and adjust the pH if necessary and you're done! (pH of 6 works great with most Capsicums).

TIPS:

- If you have a large reservoir, you can prepare a larger batch of nutrients to be used easily when needed later.
 - **Harvest booster** can be mixed together with **Part 2** in the same jar.
 - Once you have learned the basics, you can experiment a little, especially when flowering/fruiting; try to go easier with **Part 1** and increase **Part 2** in the same amount. For example instead of 10g **Part 1** in fruiting stage, try 8g and for **Part 2** try 12g for more increased flowering ratio with less nitrogen and more potassium.
- How this works, will greatly depend on the circumstances and varieties you are growing.
